

The research identified three key transitions where habits break (“the drift”)

The drift is a gradual shift where healthy routines weaken. It is not random, especially happening at three key transitions as youth grow: when life changes and parents start stepping back.

P6 to Sec 1

After-school care ends and youth receive a phone, a personal learning device (PLD), and more pocket money. Afternoons shift from adult-supervised to self-managed, but the healthy habits that were maintained by external structures have not yet been replaced by the skills to manage them independently.

- Y03 (15yo, M): "When I entered Sec 1, everything changed. New school, new friends, new timing. I had to figure everything out myself."
- Y01 (14yo, F): "I don't eat breakfast at home but eat during recess. I typically opt for food like bread, noodles, or fries."
- Y09 (13yo, F): "After school, I'm home alone. I cook dinner myself and eat alone at 7 or 8 PM."

Sec 2 to Sec 3

Peer influence becomes the dominant force in daily choices as parental visibility decreases. Sleep quality declines, screen time fills the gap, and meals are skipped because the easier option consistently wins — scrolling instead of sleeping, grabbing whatever is nearby instead of eating well, skipping exercise due to fatigue. Without practical strategies to counter this, the pattern deepens over time.

P04 (parent of 14yo & 16yo sons): "In primary school, everything was structured. Dinner at 7, homework by 8, bed by 9:30. The routine held. Then secondary school started..."

Sec 4 to JC / IHL

External structure has largely stepped back and youth are functionally self-governing. Those who developed their own routines, strategies, and reasons during Sec 1 to 4 carry them forward. Those who did not are still relying on someone else to keep their habits in place, but by this stage, that support has mostly stepped back.

- Y06 (16yo, M): "Gym is literally who I am now. I'll skip homework before I skip the gym."
- Y09 (15yo, F): "I used to swim three times a week. Then tuition started. Then exams. Now I don't do anything."

The "drift" refers to the unintentional slide away from healthy habits, not because youth choose to stop, but because they have not yet developed the skills to manage it themselves.

Youth know what healthy looks like and most want it. But three things keep getting in the way.

01

Knowing is one thing. Youth doing it by themselves when they're not ready yet creates the drift.

Someone always told them when to eat, sleep and move. Now no one is. And no one taught them how to manage it themselves.

02

Structured routines fade, choices multiply. Without practice, healthy habits are the first to slip.

By Secondary 1, bedtimes and family meals have mostly stopped. When nothing pushes you towards healthy, the unhealthy option is just easier.

03

Parents are still there. But stepping back before youth are ready creates distance instead of independence.

Parents have not stopped caring. But reminders and rules that worked at age 9 now just start arguments. The care is there. The approach has not caught up.

- Y10 (15yo, M): "I feel bad when I eat fast food. But when I'm eating it, I don't feel bad because it's nice. Maybe the next day I'll think about it. But then I eat it again when I know it's bad for me."
 - Y01 (14yo, F): "I experience a surge of energy at night, from about 7 PM to 9 PM. I find it difficult to fall asleep because I don't feel tired yet."
- Y10 (15yo, M): "I'm tired after school and gym. I just order food. Something I don't need to put work into and just wait for the food to come. Almost every day."
 - P03 (parent of Sec 1 daughter): "I work until 6. That's more than 4 hours where I have no idea what she's doing or eating."
- P09 (parent of 15yo F): "I try to ask how school was, but she just says 'fine.' The conversations stopped somewhere around Sec 2."
 - Y12 (16yo, F): "My parents just... stopped checking. I didn't know if they trusted me or just gave up."

The research showed opportunity spaces

What youth need, what parents need, what parent + youth need and what the key supporters need to make the healthy choice easier.

Youth	Parent	Parent + Youth	Key supporters (schools, peers, places, platforms)
“When I am tired after school or at night, I need small steps that fit my routine so the healthy choice feels easy.”	“When I cannot see what my youth is doing, I need ways to stay supportive without nagging or spying.”	"When we are together, we need a way to connect that doesn't turn into a lecture or an argument. When we are apart, I need to trust they have the tools and they need to trust I'm not watching."	“When youth are in school and hangout spaces, the default environment should make healthier routines easier to start and repeat.”
- Y10 (15yo, M): "Something I don't need to put work into and just wait for the food to come. Almost every day." - Y03 (14yo, F): "I no longer have a helper. I have responsibilities like cleaning the house and feeding the cats after school."	- P05 (parent of 12yo & 14yo): "In primary school I would make sure he was dressed and had breakfast. Now I just shout from outside." - P03 (parent of Sec 1 daughter): "He says he's studying. I check, and he's on TikTok. But I can't police a 15-year-old every night."	- Y04 (14yo, F): "Every time my mom talks to me it's 'did you eat', 'go sleep', 'stop your phone.' I just tune it out now." - P09 (parent of 15yo F): "I try to ask how school was, but she just says 'fine.' The conversations stopped somewhere around Sec 2."	- P08 (parent of 13yo son): "In primary school, Student Care covered him until 7pm homework done, activities, even meals. Now he's on his own from 1:30pm." - P07 (parent): "The free time that she has when we are at work... we are also wondering what is she doing. Most of the time she'll be at home sleeping."

How our HMW evolved

As we learnt from our research findings and feedback from the HPB team, our HMW statement evolved to become more focused

Youth already know what is healthy. The research showed that what is missing is the desire to act on it, especially when peer pressure, screen time, and convenience are pulling in the other direction.

Healthy habits are not built alone. Parents, peers, teachers, and the spaces youth spend time in all play a role. This recognises that the people and environment around them shape their choices just as much as their own intentions do.

“HMW motivate youth (aged 13–16) and their key supporters to build their confidence to start and sustain healthy habits across the 6 Wells (Eat, Sleep, Exercise, Learn, Bond, and Screen Time), so that healthier choices become natural, even as routines change and independence grows?”

Starting is one thing. Keeping it going is another, especially when routines get disrupted by exams, new schools, or shifting friendships. Confidence here means believing they can pick it back up even after a slip.

This is the north star. The goal is not perfection or constant effort. It is that healthy choices eventually feel like the obvious thing to do, even as life keeps changing and independence grows.

How the HMW connects to HIIP

Each part of the HMW statement maps to HIIP

“HMW motivate youth (aged 13–16) and their key supporters to build their confidence to start and sustain healthy habits across the 6 Wells (Eat, Sleep, Exercise, Learn, Bond, and Screen Time), so that healthier choices become natural, even as routines change and independence grows?”

HMW keyword	What it means	HIIP it connects to
“ motivate ”	Youth already know what is healthy. What is missing is the push to actually do it, and that push needs to connect to what matters to them right now, and that push needs to connect to what matters to them right now, like energy, appearance, and social credibility, rather than long-term health outcomes.	Give them a reason to want to do it (Inspiring)
“ key supporters ”	Healthy habits are not built alone. Parents, peers, and the environment all play a role, and the approach needs to work for everyone involved, not just the youth.	Fit health into life (Holistic, Personalised)
“ build their confidence ”	Youth need to feel they can actually keep this going by themselves. That confidence is built from small wins that they can see and feel, not not from hearing encouragement alone.	Give them a reason to want to do it (Inspiring)
“ natural ”	The healthy choice should not feel like extra effort. When it fits into what they are already doing, they are more likely to stick with it without being reminded.	Make healthy habits feel easy (Intuitive)
“ routines change and independence grows ”	Whatever we design has to survive real life. New schools, exam weeks, shifting schedules, and growing independence all change the day. The solution has to move with them, not fall apart when things shift.	Fit health into life (Holistic, Personalised)

Two things co-creation made clear

One about parents. One about youth. Both point in the same direction.

01

Takeaway 1 - Parents

Parents came in with real self-awareness and a genuine desire to help. But the strategies they rely on were built based on their child's primary school time and they struggle to use that same method when their children grows up.

"I need to change myself too." They are not the problem. They just need tools that match where their child is now.

- *Kartika (parent, co-creation): "We only have one. I don't have the ability to try and see. As a first-time mum and she is a first-time teenager."*
- *Calvin (parent, co-creation): "Feel it is too late now to set a rule."*
- *Kartika (parent, co-creation): "It is difficult because I also do that."
(on being on the phone in the morning)*

02

Takeaway 2 - Youth

Youth already know what's healthy. What they need is the how — practical steps they can do, not just reasons why. When we asked them to design their own solutions, every idea changed something around them (the room, the routine), not something inside them. Not one idea was 'try harder.'

- *Amanda (youth, co-creation): "Once take back, I will go back to my sneakier behaviour!"*
- *Keey (youth, co-creation): "I cannot survive. I need stimulation like TikTok and talk to my friends."*
- *Natasha (youth, co-creation): "I can survive without phone, can use computer. No motivation to do anything."*

Both findings point to the same gap: the handover happened, but the tools and skills to fill it did not.

They also shared the same concerns

Youth

Youth are open to healthy routines even with rules (when they understand the reason behind them). What they resist are rules that feel one-sided or unexplained. They want practical guidance on how, not just the 'why'.

Parent

Parents want to guide, not control. But as children grow, their parenting needs to evolve too. For many, the first child becomes the learning ground for figuring out what works. The instinct is right but the approach just hasn't caught up yet.

Both parents and youth recognise the same concern: **screens are affecting sleep, restriction triggers resistance not change, and trust is what holds everything together.** Co-creation found that they share these concerns but they just experience them from different sides.

This suggests that the focus should not be just on youth OR parents. **It's the rhythm they share.** Design needs to **give youth structure that doesn't feel imposed**, and **help parents evolve their approach** as their children's independence grows.

What co-creation confirmed

We found two “windows” where unhealthy choices quietly build up

In primary school, adults structured the whole day. In secondary, two large windows open up where unhealthy choices happen without any adult awareness or support.

Night (9pm–1am+)

“Window 2”

Phone in bedroom. No enforcement on bedtime. Sleep is entirely self-managed. Screen use affecting sleep time when they are alone in the room.

Evening (6–9pm)

Parent presence returns but limited. Dinner if family eats together. Completion of homework. Some youth are attending tuition class 2–3x/week.

Morning (6:30–7:30am)

Youth wakes to phone alarm, scrolls before getting up. Minimal breakfast if any.

School (8am–1:30pm)

The only fully structured window. PE, canteen, timetable — all held by school. *This is where HPB's current touchpoints sit.*

After School/CCA (2–6pm)

“Window 1”

~4 hours unsupervised. No Student Care Centre equivalent in secondary. 0 out of 6 parents present. Screen, snacks, peer influence fill the gap. Some school canteens are closed- socialising with peers at fast food such as McDonald's, Jollibee, Sukiya

We want to move them from 'Vicious' to 'Ideal' cycle

X-AXIS

The X-axis maps how far health knowledge translates into action. From knowing but not doing on one end to knowing and doing on the other.

Y-AXIS

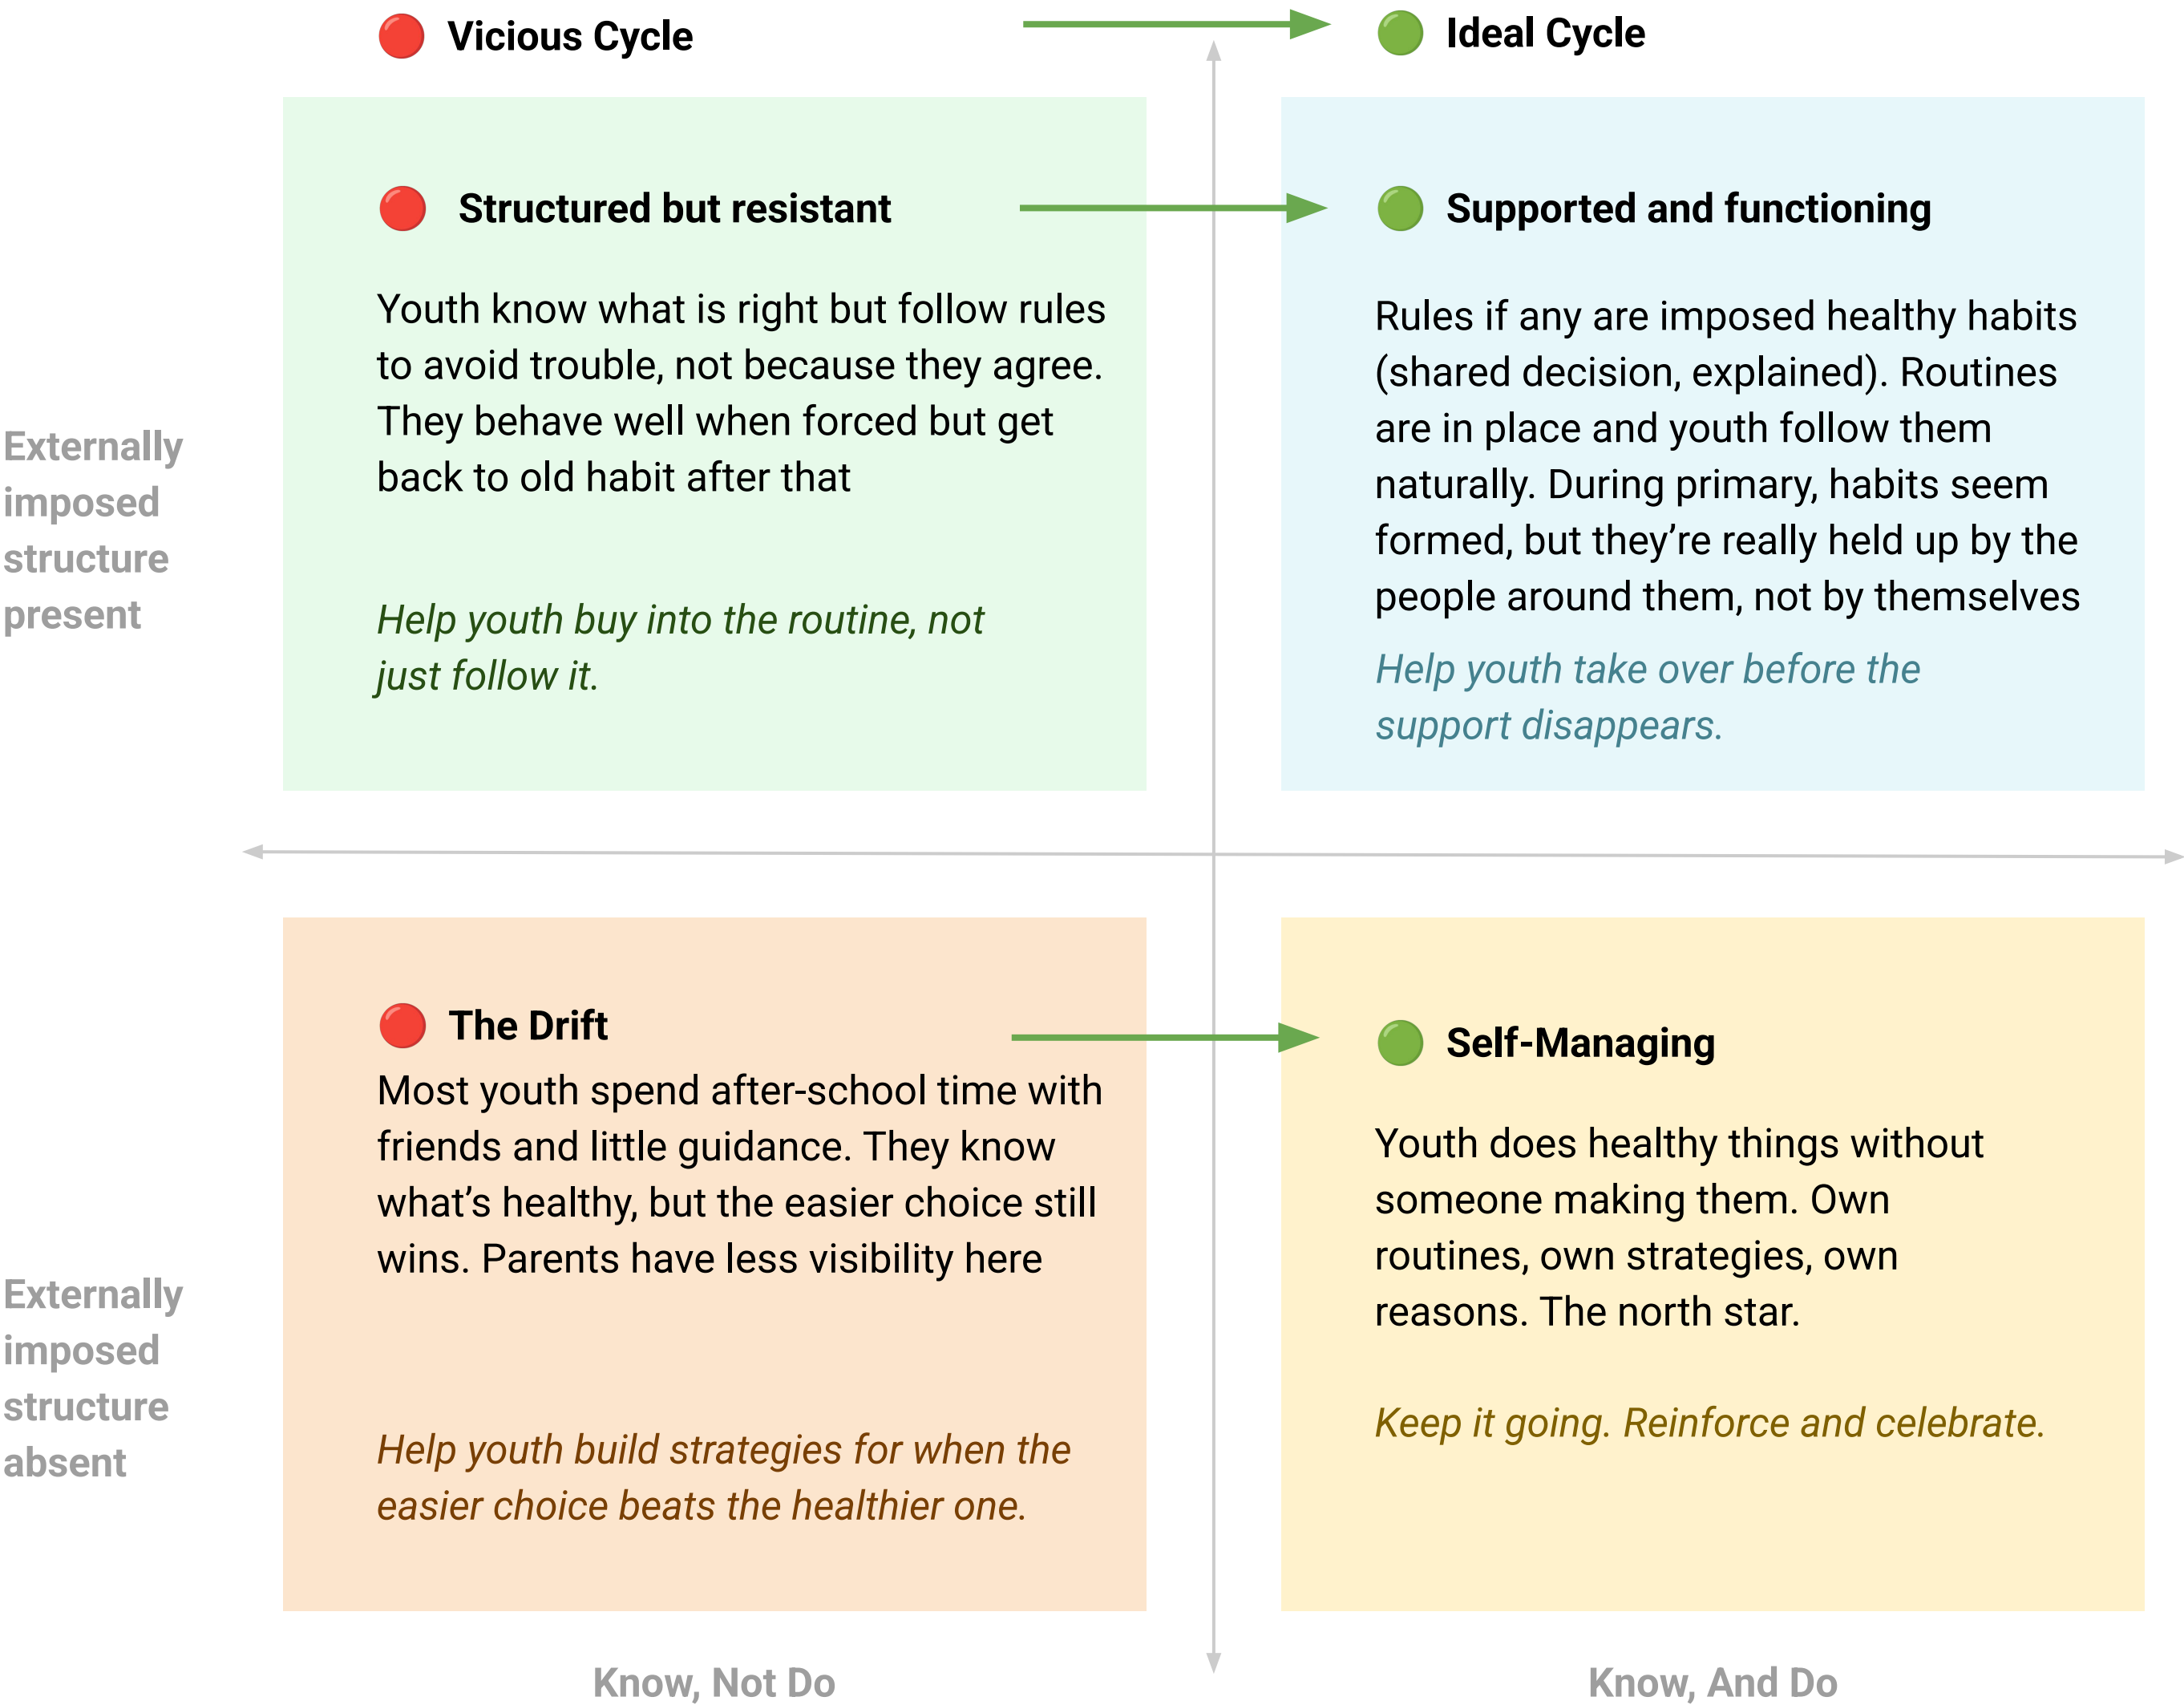

The Y-axis shows the presence of structure. From structure absent at the bottom to structure present at the top.

WHAT THIS HELPS US SEE

The current state is a vicious cycle: youth drifts, parent adds structure, youth resists, both get stuck. The desired state is a virtuous line: practical strategy, small win, growing confidence, less need for control.

FROM VICIOUS TO IDEAL

- Vicious: Drift → Rules added → Youth pushes back → More rules or give up → Further drift. A loop.
- Ideal: Practical strategy → Small win → Feels capable → Parent adjusts approach → Builds on it. A line.

Where we want to get to

Our North Star

Healthy habits become the natural choice for youth — supported at key moments, shaped through shared routines, and sustained through growing independence

Empowered Transitions

Support at the moments where habits drift

Primary 6 to Secondary 1, Secondary 2 to Secondary 3, and Secondary 4 to Poly or JC. These are the moments when routines reset and influence shifts. We will support youth with practical tools that fit their day.

Shared Rhythm

Turn ‘windows’ into shared routines

It’s not about constant monitoring or stepping back completely. It’s about small shared routines that both sides help shape. The relationship itself becomes the structure, not a set of rules.

Confidence Loop

Build autonomy through small wins that strengthen trust and routines

Young people try something, it works, parents notice, trust grows and with that, youth gain more freedom. It’s a positive cycle that builds on itself

Anchored to: "How might we motivate youth and their key supporters to build confidence to start and sustain healthy habits, so healthier choices become natural as routines change and independence grows?"

Where we want to get to

Design Principles

We defined 3 design principles. Each principle resolves a core tension from the research. They guide what we design and what we do not.

01

Autonomy with guardrails

Design for shared structure, not control.

It's not about choosing between freedom or control. It needs both where youth decide how things are done and parents work together with them. Together, they create a structure that works for both sides.

02

Replace, do not restrict

Never restrict behaviour without introducing alternatives

Taking something away only works if you replace it with something else. Screens and fast food are not just habits, they meet emotional and social needs. If you remove them without offering alternatives, youth will find workarounds. The goal is to design what fills that space and not just removing something away.

03

Make it fit the day they already have

Strengthen existing behaviours before introducing new ones.

Youth and parents are already busy. If something doesn't slot into the day they already (the after-school hangout, the bedtime window, the dinner table), it won't get used. We design for real schedules, not ideal ones.

How our design principles connect to HIIP x PME

HIIP Design Principles PME	Design for shared structure, not control	Never restrict behaviour without introducing alternatives	Strengthen existing behaviours before introducing new ones
Persuade (adopt positive intentions)	Make it fit the day they already have Connect to their actual schedule. If it doesn't slot into the after-school hangout, the bedtime window, or the dinner table, it won't get used. Show how it fits the day they already have, not an ideal version of it.	Replace, don't restrict Tie the alternative to what youth actually care about. Energy, appearance, social credibility. Avoid generic health messaging that feels impersonal. The replacement needs to feel better than what it replaces.	Make it fit the day they already have Present options that feel immediately doable. Limit choices to prevent overwhelm. Make the healthy option the one that requires the least effort to start.
Motivate (increase internal motivation)	Autonomy with guardrails Acknowledge real constraints like exams and tuition. Allow flexible progress that keeps momentum going. Frame commitments as short experiments ("5 nights", "14 days", "For Now") so nothing feels permanent.	Replace, don't restrict Connect progress to goals that feel meaningful to them. Celebrate what they can see and feel today, not distant health outcomes. Focus on personal wins, not comparison with others.	Make it fit the day they already have Stack new behaviours onto things they already do. Scale the intensity so there is always something manageable even on difficult days. Protect progress so one slip doesn't reset everything.
Empower (close intention-action gap)	Autonomy with guardrails Give youth control over when and how they engage. Let them choose, adjust, and come back on their own terms. Provide multiple ways to reach the same goal. Remove pressure and guilt from the experience.	Autonomy with guardrails Let youth set their own definition of success. Offer simple steps that feel achievable. Respect their preferences and circumstances rather than pushing toward a fixed standard.	Replace, don't restrict Provide quick feedback that sustains momentum. Give instant recognition when something is completed. Use small, tangible signals of progress to keep the positive feeling going between sessions.

From research to ready-to-test: how we got here

Each phase built on the last. Nothing was invented. Everything was drawn from what we heard.

How we went from 25 ideas to three concepts worth testing

Every idea was tested against four things. Only the ones that passed all four made it through.

How we chose what to build

What exists, what we heard, and what we did differently

Each concept was shaped by co-creation ideas, market references, and deliberate design choices to address what existing solutions miss.

	Bedtime Wind-Down	Hook U Up (Peer Challenge)	WOU (We Open Up)
What already exists	Sleep tracker apps (Sleep Cycle, Calm), bedtime checklists, parental control apps that lock phones at set times. Most are digital, individual, and either youth-facing or parent-controlled.	TikTok challenges, fitness streak apps (Strava, Nike Run Club), gamified habit trackers (Habitica). Most are digital, individual, and built around solo accountability.	Conversation card games for families (The And, Where Should We Begin, Ungame). Most are designed for couples or general bonding, not the parent-teen power imbalance.
What co-creation told us	Youth designed sleep solutions around the environment, not willpower. "Make the room cooler." "Make the bedroom comfortable." Every idea changed something around them. Parents said taking the phone away causes rebellion.	Youth in both batches already had their own peer systems. \$15 weight loss bets, “fining” (payment) friends for fast food. They were already doing it informally. They also told us motivation works when it connects to appearance, energy, and social credibility.	Parents said "everything is about trust." Youth said "you don't trust me?" Both sides want connection but neither knows how to start without it becoming a lecture or an argument.
What we looked at	Fridge magnets and magnetic routine boards used in early childhood. They work because they are visible, tactile, and don't need a screen. But they are designed for young children and controlled entirely by parents.	Physical challenge card decks and the TikTok "do it with me" format where pairs hold each other accountable. Youth slang and identity framing from social media trends.	Dating conversation games (We're Not Really Strangers) that use escalating questions to build vulnerability. The "reveal at the same time" mechanic from party games that levels the playing field.
What we changed	We flipped the ownership so the youth picks the magnets, not the parent. We added a parent column so both sides have commitments. We framed it as a 5-night experiment, not a rule. And we kept it physical because a phone in the bedroom is the problem, not the solution.	We made it physical because the after-school window is already dominated by screens. We named the topic decks after what youth said matters to them (Glow Up, Bulk Up, Cut Season) instead of health categories. We added the shield mechanic because Amanda warned us that penalties cause spite, not change.	We built the simultaneous reveal to prevent either side from dominating, which is the exact problem our research surfaced. The "For Now" framing came from the finding that permanent rules trigger resistance. And the topics are drawn from real interview scenarios, not generic icebreakers.
What makes it different	It's not a tracker or a parental control tool. It's a shared plan both sides own. The environment does the work before anyone has to make a decision. And it lives in the bedroom as a visible reminder that doesn't need charging or logging in.	It's not an app with notifications. It's a physical object friends pass between each other. The language speaks to what youth care about right now, not what adults want them to care about. And accountability is peer-to-peer, which our research showed is the strongest motivator when no parent is present.	Every question is grounded in the real tensions we heard in our research. The mechanic is designed to stop the pattern our participants described: one side lectures, the other shuts down. Existing conversation games are built for general bonding, not for navigating the specific trust gap between 6 parents and teenagers around daily routines.

How we chose what to build

From trial to habit: how short-term testing leads to long-term change

Each concept is designed to start small and build. Here is the pathway from first use to sustained behaviour.

Bedtime Wind-Down

Short term (testing)

Youth picks the magnets they would actually use and tries the routine for 5 nights. Parent joins for a brief check-in then leaves.

The routine starts to stick on school nights. Weekly reviews feel natural, and the youth adjusts their magnets as things change — exams, holidays, new schedules.

Long term (months)

The wind-down becomes automatic. The youth manages their own sleep without needing the board. The parent check-in stays not as a control tool, but as a connection point both sides value.

Hook U Up

Buddy pair picks a topic deck and completes their first 14-day challenge together. The streak builds momentum as they go.

The pair picks a second topic deck and other friends start joining in. The challenge becomes something the group just does.

Healthy behaviours become part of peer identity ("we are the type who do this"). Challenge format no longer needed because the habits run on their own.

WOU (We Open Up)

First game session. The 'Swap' surprises both sides because they didn't expect to be wrong about each other. By the end, they agree on one small 'For Now' decision together.

Conversations start happening outside the game without anyone planning it. The parent shifts from telling to asking, and trust grows from there.

Open communication becomes the default. The youth shares routine pressures willingly, and when the parent offers guidance, it actually lands because the trust is already there.

Three concepts, each grounded in research

Three concepts, each grounded in what we heard

Concept	What it is	Research finding it responds to	Design principle(s)	HMW connection
Bedtime Wind-Down <i>Build your bedtime routine. Together.</i>	A physical magnet board where youths design their own wind-down routine. youth picks the magnets, parent agrees and adds their own commitments. Weekly review built in. Reusable all year.	Sleep is the most vulnerable habit - it has no driver once parental enforcement withdraws. The screen-sleep loop entrenches by Sec 2. Restriction backfires; when youths own the routine, they follow it.	Shared structure, not control Replace, don't restrict	Supports youth and parents to build habits that hold as routines change - translating knowledge into action at the moment it matters most.
Hook U Up <i>Pick a card. Find a buddy. Do it together.</i>	A physical card deck for youth buddy pairs. 5 topic areas (Glow Up, Bulk Up, Cut Season, Recharge, Energy Era), 14-day challenge, one card per day. Proof uploaded by QR code. No app required.	Peer influence fills the 2-6 pm supervision gap after school. youths already know what is healthy - what they lack is a practical, low-friction way to act on it. Motivation is stronger when anchored to what youths already care about (appearance, energy, identity) rather than health messaging.	Replace, don't restrict Fit the day they already have	Builds confidence to start and sustain habits, using peer support rather than adult direction, so healthy choices feel natural as independence grows.
WOU (We Open Up) <i>A card game for parents and youths. No agenda. Just talk.</i>	A family card game with three mechanics: Question/Category cards (conversation starter), Swap (answer as each other), Spark (go deeper). Both sides answer the same questions - no one is lectured, no one is interrogated.	Parents want to help but their strategies were built for a younger child. When parents guide with control, youths resist. Both sides want connection but neither knows how to start. Shared vulnerability works better than one-sided advice.	Shared structure, not control Replace, don't restrict	Equips key supporters (parents) with a tool that fits where their child actually is, so they can support without controlling.

Why we choose that medium?

	Concept 1 - Bedtime Wind-Down	Concept 2 - Hook U Up	Concept 3 - WOU (We Open Up)
Medium	Physical magnet board + routine cards	Physical card deck with challenge themes	Card game with a reveal mechanic
Why this format	The room changes before the youth has to decide anything. A physical board in the bedroom works as a persistent cue that doesn't need an app to open or a habit to remember. It puts the environment first, not willpower.	Youth already challenge each other, from betting on weight loss to fining friends for eating fast food. This takes that existing peer behaviour and gives it a structured format they can hold, shuffle, and play without a screen.	Parents and youth tend to talk past each other. A card game with a simultaneous reveal means neither side gets to dominate the conversation. Physical cards on a table slow things down in a way that a phone screen or a lecture simply cannot.
Why not digital	A phone in the bedroom was a prevalent challenge. Solving sleep with an app puts the trigger right back in their hands. A physical board stays visible without anyone needing to unlock anything.	Youth already spend their after-school time on screens. A physical card deck displaces screen time rather than adding to it. It also passes HPB's "no standalone app" guardrail.	The whole point is face-to-face conversation. A digital version takes away the eye contact, the table, and the shared moment. For this concept, the medium is the mechanic.
Design principles	"Replace, don't restrict" because it replaces scrolling with a wind-down routine instead of just taking the phone away. "Autonomy with guardrails" because the youth sets the start time and picks the steps, and the parent agrees and shows up briefly.	"Make it fit the day they already have" because it slots into the after-school hangout time that already exists. "Replace, don't restrict" because it replaces passive scrolling with a social activity, not by removing the phone but by making something else more appealing.	"Autonomy with guardrails" because youth and parent negotiate together and neither side dictates. "Replace, don't restrict" because it replaces nagging and surveillance with a structured conversation that both sides authored.
Hard constraints	Within scope (sleep, screen, and bond wells). Non-digital. Pilot-ready because the magnet board is low-cost and testable with 30 youth. Tight budget since it only needs magnets and printed cards. Does not conflict with the GWSG Message House.	Within scope (eat, exercise, and screen wells depending on the challenge chosen). Non-digital. Pilot-ready because the card deck is printable. Tight budget since it only needs printed cards. Designed for ages 13 to 16 with no parent involvement needed.	Within scope (bond well, which unlocks sleep and screen). Non-digital. Pilot-ready because the card set is printable. Tight budget. Designed for parent and youth to use together. Aligns with the GWSG Message House on parent-youth relationship.

Why we choose that medium? - cont.

	Concept 1 - Bedtime Wind-Down	Concept 2 - Hook U Up	Concept 3 - WOU (We Open Up)
Reality checks from research	Does not lead with "health." It leads with "feel better in the morning." It survives exam weeks because the routine is short and the 5-night trial framing lowers resistance. It avoids a single-well fix because it cascades across sleep, screen, and bond. It fits into existing routines because it takes minutes, not a whole new activity.	Does not lead with "health." It leads with looking good, energy, and social credibility. It works without parent policing because it is entirely peer-led. It fits into existing routines because each check-in takes 30 seconds at the after-school hangout. It avoids a single-well fix because the challenge themes span eat, exercise, and screen. It survives exam weeks because the 5-day format keeps commitment low.	Does not lead with "health." It leads with fairness and trust. It works even when communication has narrowed because it was designed for low-trust households. It fits into existing routines because it takes 15 to 20 minutes at the dining table. It avoids a single-well fix because the bond well unlocks willingness to engage on sleep, screen, and eat.
Fairness and ownership	Ownership is clear: the youth owns the routine and the parent owns the brief check-in. The framing is collaborative ("let's try this for 5 nights") rather than punitive.	The framing decides whether this bonds or embarrasses. There is no public leaderboard of failures, and the shield mechanic allows one slip without breaking the streak. Ownership sits with the peer group, not with the school or the parent.	The simultaneous reveal means neither side gets to dominate. The "For Now" framing reduces defensiveness because nothing feels permanent. Both sides co-author the agreement, so ownership is genuinely shared.
Scalability (physical first, digital later)	The physical magnet board works on its own. Once validated, it can scale to a digital version within Health365 or HealthHub as a routine tracker.	The physical card deck works on its own. Once validated, it can scale to a digital challenge format within the HPB ecosystem, for example through the Healthy 365 challenge feature.	The physical card set works on its own. Once validated, it can scale to a guided digital conversation tool within HealthHub, or be distributed through parent gateway letters.

Concept testing and validation

Objectives

- Test usability & clarity
 - How easily participants understand and use each prototype
- Assess real-life fit
 - When/where prototypes fit family routines
- Capture reactions
 - Emotional responses and relationship impact
- Check role clarity
 - How prototypes define youth/parent/school responsibilities
- Prioritise next steps
 - Features to keep, change or drop

Methodology

- Individual 60-minute online sessions with 12 youths (13–16 years old) + 12 parents
- Moderated session
 - Warm-up (10 minutes): Conversation about daily routines, key pressure points and current approaches to health and routines
 - Prototype testing (35–45 minutes): Hands-on interaction with 2–3 early concepts using realistic scenarios and think-aloud protocol
 - Per-prototype ratings (~15 minutes): Five 7-point Likert scale questions capturing overall experience, likelihood of use, ease, pressure/control perception and routine fit
 - Final ranking (5 minutes): Participants rank prototypes from most to least preferred and explain their reasoning.

Participants

- Youths: **n=12**
 - n=6 (13-14 years old)
 - n=6 (15-16 years old)
- Parents: **n=12** (aligned with HPB)
 - To include:
- Active parents deeply engage with their youth
- transgenerational family
- to include experienced parents (parents with child >18 y/o)

Success metrics: What a strong result looks like for each concept

We are setting the bar now, before we see the results. This is what each concept needs to show to move forward.

Bedtime Wind-Down

- The youth chooses magnets that reflect what they would actually do, not what sounds good.
- The parent column feels fair to both sides, not like surveillance.
- The weekly review feels manageable, not like another task.
- Both the youth and parent can see themselves using it beyond the first week.

What this leads to over time

The routine becomes something the youth owns, not something they were told to do. As it repeats, the wind-down stops needing the board, the behaviour carries on because it was built by them, not imposed on them.

Hook U Up (Peer Challenge)

- Youth understand the buddy format and know what to do without being told.
- They can name a real person they would do it with.
- The topic deck feels relevant to them now, not in the future.
- They would try at least one challenge without being asked.

What this leads to over time

The first 14 days get them started. But with 5 topic decks and friends joining in, the challenge becomes part of how the group spends time together. Over repeated cycles, the healthy behaviour shifts from "something we're trying" to "something we just do."

WOU (We Open Up)

- Both parents and youth say it does not feel like a health intervention.
- The Swap mechanic surprises them - they did not expect to be wrong about the other person.
- Parents feel less like an enforcer. Youth feel less singled out.
- Both sides would play it again.

What this leads to over time

The game opens the door, but what keeps it open is the trust that builds from playing it. Once parents and youth can talk without it turning into a lecture, conversations about sleep, screens, and eating happen on their own without needing the cards.
